

Session 11 — Team Work Task

Goal

Right now, filtering the task list to one specific person can end up showing an empty list with no explanation. Your job: detect when the currently-selected person no longer has any tasks, and automatically send the filter back to "All people" — so the app never silently shows an empty, unexplained list.

Starting state

You're starting from today's live-code checkpoint. Reset, delete confirmation, combined title+owner editing, Enter/Escape, and `AddTask` mount-gating are all already working. Neither `handleDelete` nor `handleSaveEdit` currently does anything about the person filter — they only update `tasks`.

What to build

Update `handleDelete` and `handleSaveEdit` so that, after either one changes `tasks`, the app checks whether the currently-selected person (if any) still owns at least one task. If they don't anymore, the filter should return to "All people" (the same state as clicking the "All people" button).

The exact same check must work correctly after BOTH actions:

- **Delete** can remove the selected person's last remaining visible task.
- **Edit** can change a task's OWNER away from the selected person, which can just as easily leave them with zero remaining tasks — even though no task was deleted.

Rules

Allowed / already known after today's live coding: everything from Sessions 05–11 (`useState`, callback props, conditional rendering, `.map()` / `.filter()` / `.find()` / `.reduce()`, typed props, `useEffect`, `window.confirm`, `onKeyDown` / `KeyboardEvent`, mount-gating).

Not yet / do not use: React Router, Context, custom hooks, `useMemo` / `useCallback`, any state-management library, `localStorage`, any array method not already used elsewhere in this project.

Do not change what Delete, Edit, Reset, or anything else already does — this only ADDS one new piece of reasoning on top of two existing handlers. If the selected person still has tasks remaining, nothing about the filter should change.

Test it — work through all four scenarios

A. Select a person who has exactly one task. Delete that task. **Expected:** the filter returns to "All people" automatically.

B. Select a person who has two or more tasks. Delete one of them. **Expected:** that person remains selected — the filter does NOT change.

C. Select a person who has exactly one task. Edit that task and change its OWNER to someone else (leave the title alone, or change it too — either way). **Expected:** the filter returns to "All people" automatically.

D. With NO person selected ("All people" already active), delete or edit tasks freely. **Expected:** nothing about the filter changes — there was nothing to reset.

Also confirm: the SAME underlying check works for both Delete and Edit — you should not need two different, unrelated pieces of logic that happen to do similar things.

Done when

- ☐ Scenario A: deleting a selected person's last task returns the filter to "All people".
- ☐ Scenario B: deleting one of several tasks leaves the person filter unchanged.
- ☐ Scenario C: editing a task's owner away from the selected person, leaving them with zero tasks, returns the filter to "All people".
- ☐ Scenario D: with no person selected, Delete/Edit never change the filter.
- ☐ The same reasoning is used for both Delete and Edit, not duplicated as two unrelated checks.
- ☐ Every existing Session 05–11 behavior still works exactly as it did in the checkpoint.
- ☐ `npm run build` passes with no errors.

Hint

You already have everything you need to answer "does this person still have any tasks?" — you've written a `.filter() / .find()` over a `tasks` array checking `task.userId === someId` more than once already this course. The only new question today is WHEN to ask it, and what to do with the answer.
